

That was a question?

Accommodating variability in intonation interpretation

Andrés Buxó-Lugo & Chigusa Kurumada

Intonation communicates intentions

► Intonational representations cue intended meanings of utterances in context

► Low-level acoustic signal mapped onto intonational representations

(e.g., Bolinger, 1986; Cutler, 1977; Dahan, 2015; Ladd, 1983; Pierrehumbert & Hirschberg, 1990)

Puzzles related to **variability**

► In speech, intonational categories are realized in widely varied acoustics

- Linguistic contexts
- Socio-indexical features
- Speaking conditions

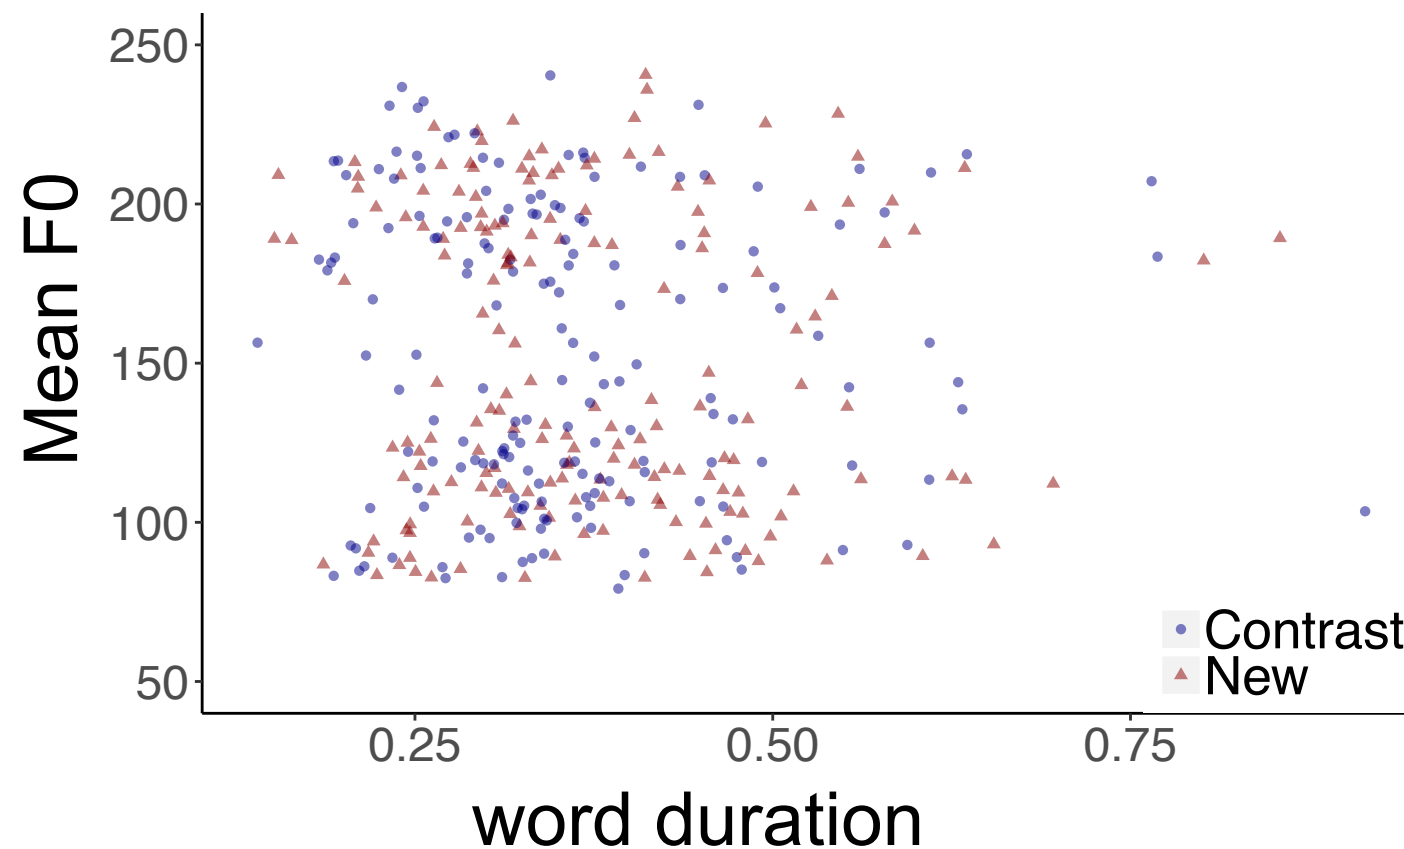

(e.g., Clopper & Smiljanic, 2011; Cole, 2015; Grabe et al., 2005; Green, 2002; Holliday, 2019; Ladd, 2008; Podesva & Callier, 2015; Warren, 2016)

New vs. Contrast

- ▶ “Red, green, blue. White, **gray**, black” [New]
- ▶ “White, green, black. White, **gray**, black” [Contrast]

New vs. Contrast

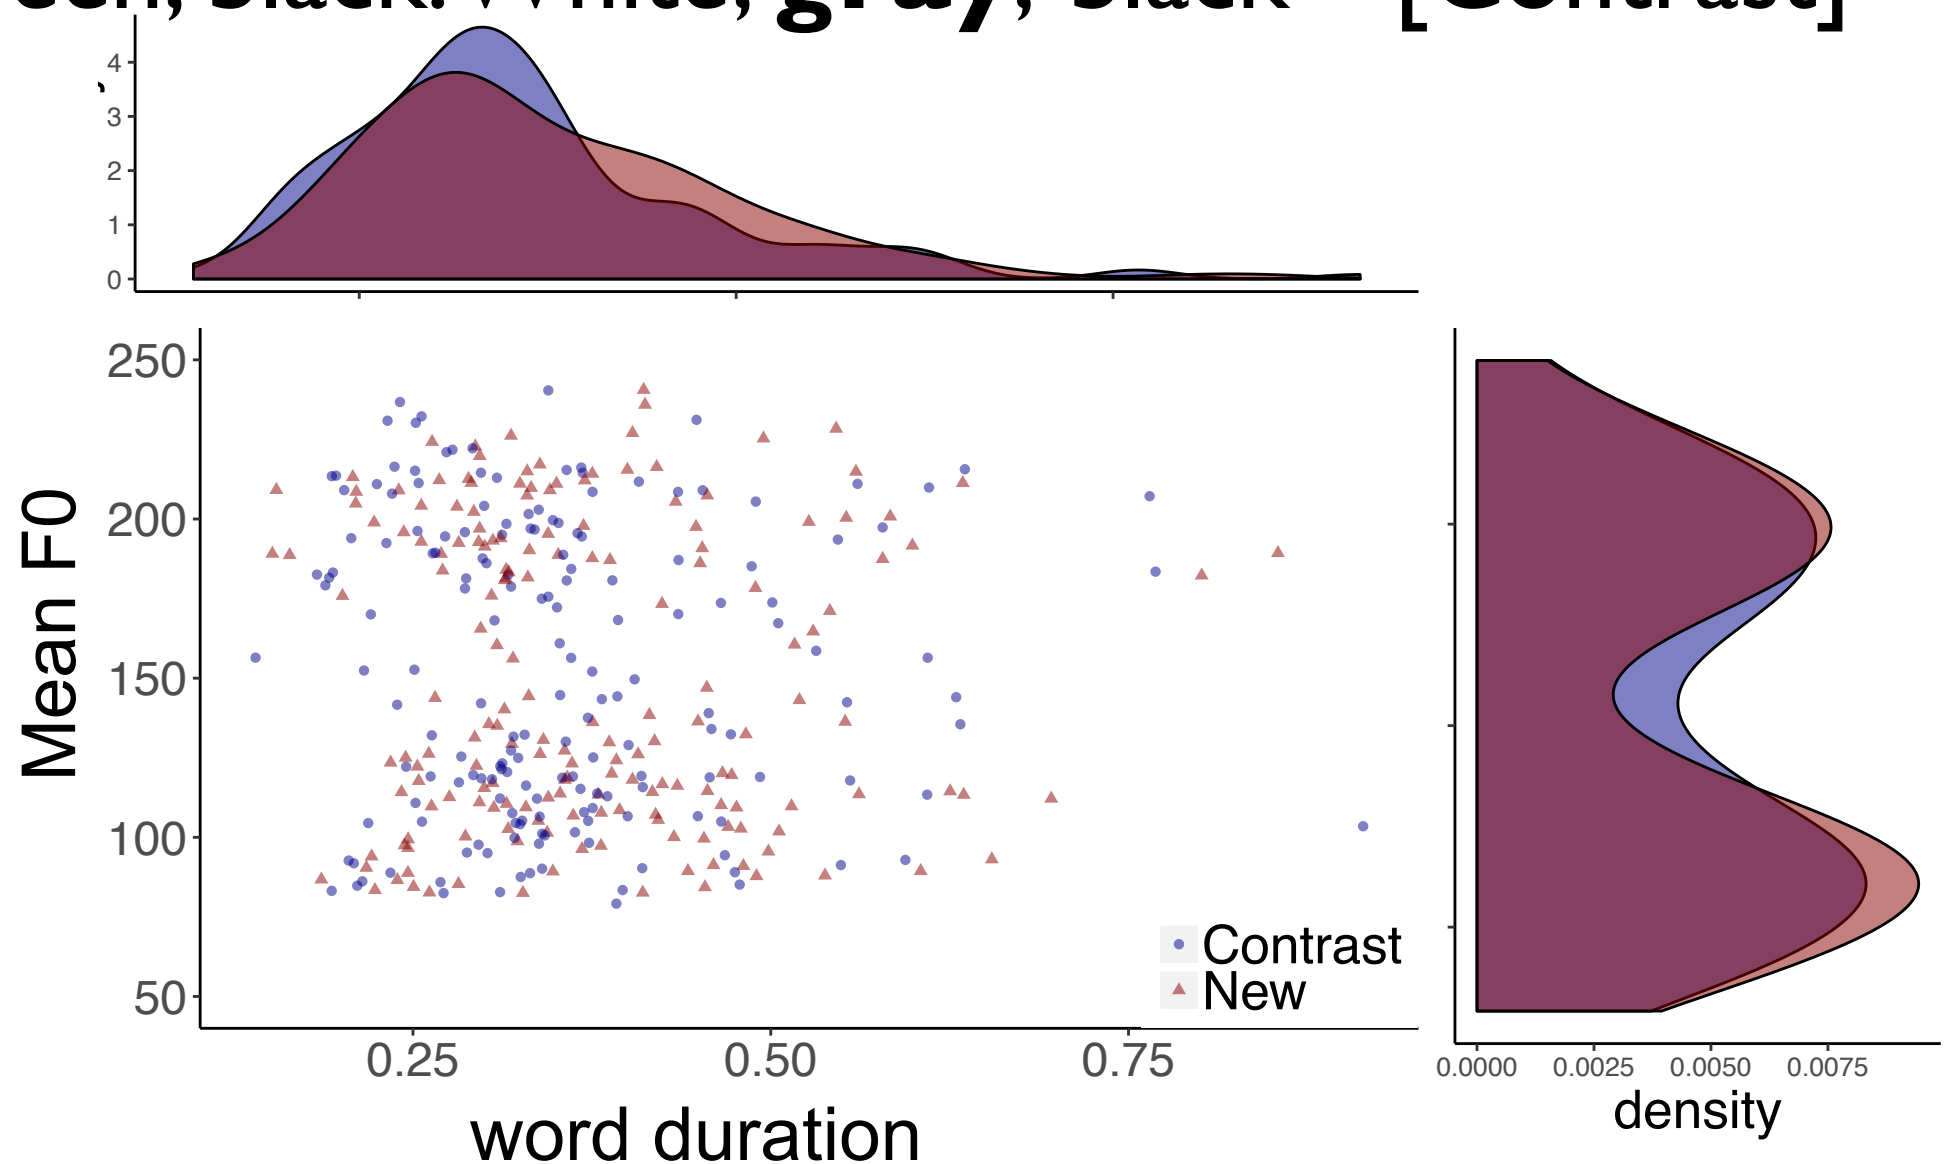

- ▶ “Red, green, blue. White, **gray**, black” [New]
- ▶ “White, green, black. White, **gray**, black” [Contrast]

(e.g., Buxó-Lugo, Toscano, & Watson, 2018)

New vs. Contrast

- ▶ “Red, green, blue. White, **gray**, black” [New]
- ▶ “White, green, black. White, **gray**, black” [Contrast]

(e.g., Buxó-Lugo, Toscano, & Watson, 2018)

Accommodating variations

1) Normalization

- ▶ Interpreting acoustic variations in proportion to a contextually defined baseline
e.g., male vs. female have different baseline pitch

2) Adaptation

- ▶ learning statistical patterns of the input particular to a given context and speaker
e.g., individual speakers express the same intonation contour with different combinations of acoustic cues

(Cole, 2015; Dilley & Pitt, 2010; Johnson & Mullenix, 1997; Kraljic & Samuel, 2008; McMurray & Jongman, 2012; Nearey, 1978; Norris et al., 2016, Summerfield, 1981; *inter alios*)

Current study

- ▶ We investigate normalization and adaptation looking at **question vs. statement** intonation
- ▶ (Thought to be) a binary classification with contrasting interpretations

Current study

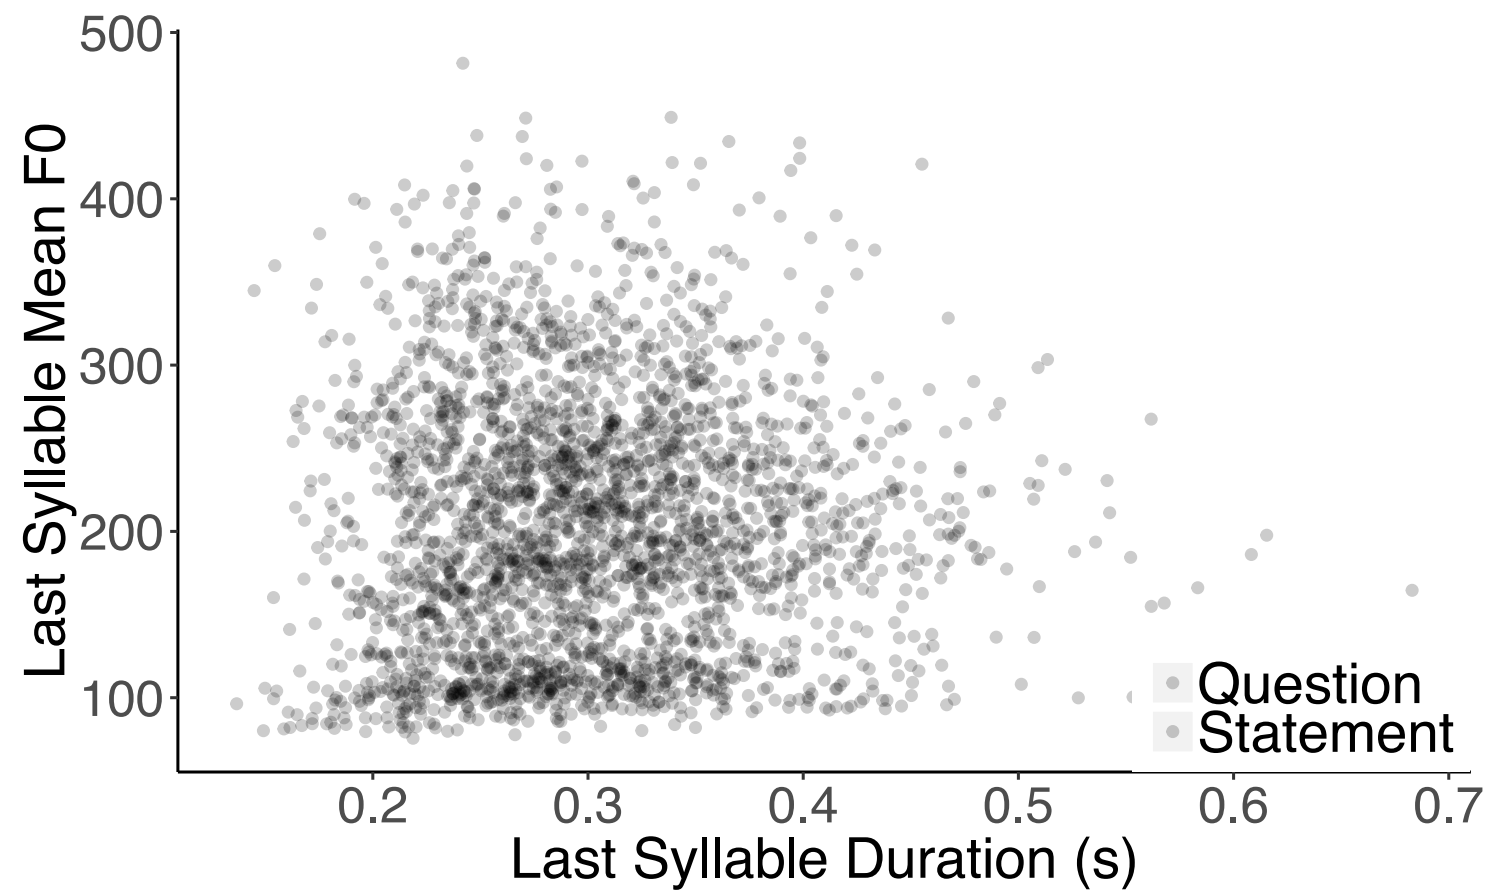

- ▶ We investigate normalization and adaptation looking at **question vs. statement** intonation
 - ▶ (Thought to be) a binary classification with contrasting interpretations
- ▶ **Study 1: Production:** To what extent do native speakers vary in their use of intonation?
 - ▶ **Study 2: Comprehension:** Can native listeners adapt to speaker-specific variations of intonation?

Study I: Production

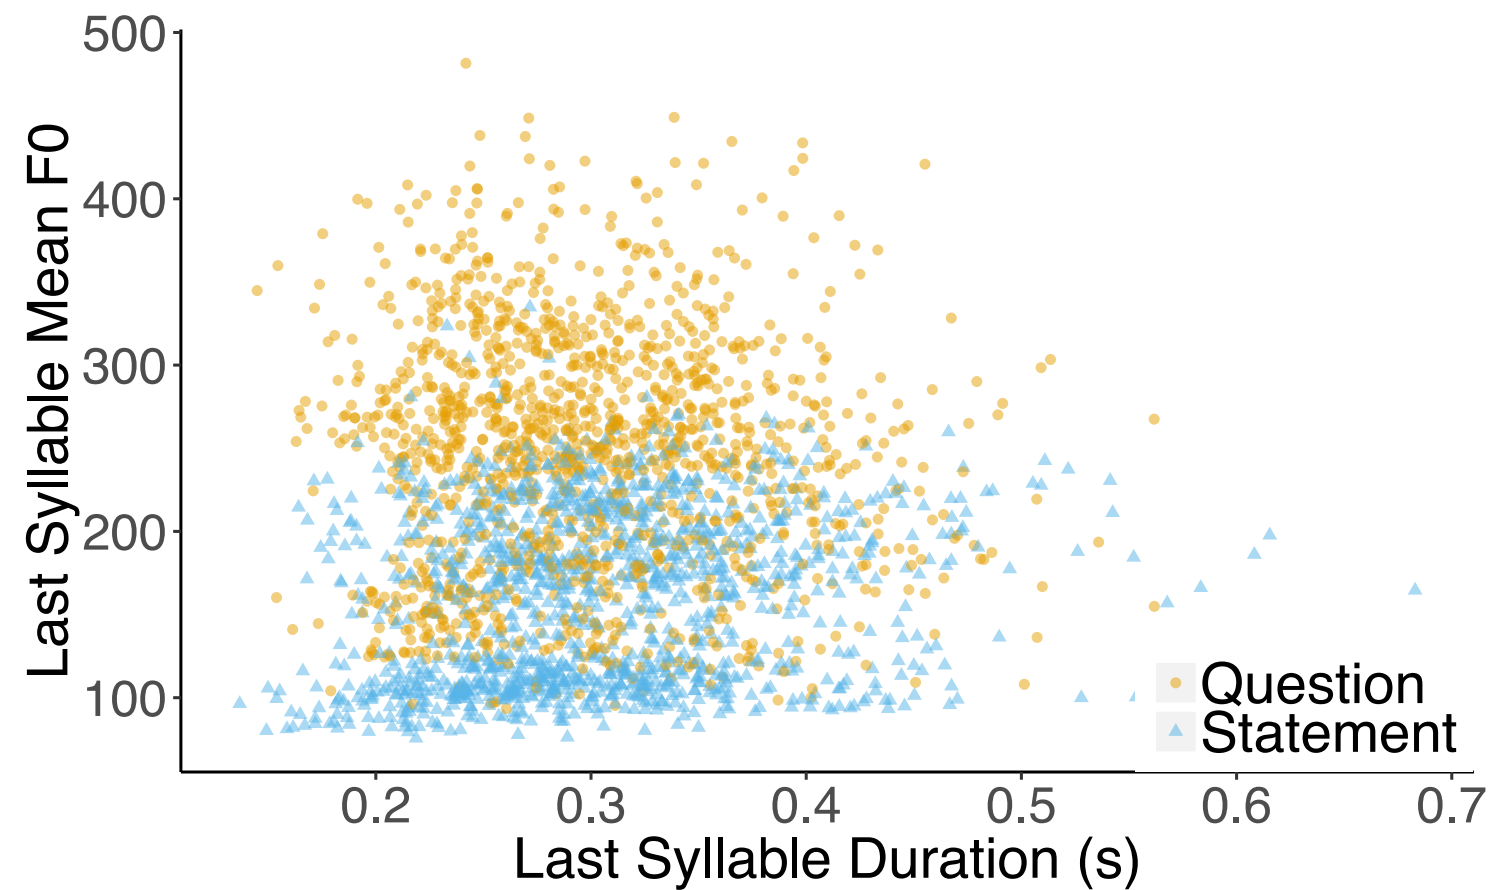

- ▶ **59** Native speakers of American English (45 Female)
- ▶ 48 sentences
 - ▶ “It’s X-ing” (e.g., It’s raining)
 - ▶ 24 verb types (produced as a question vs. statement once each)

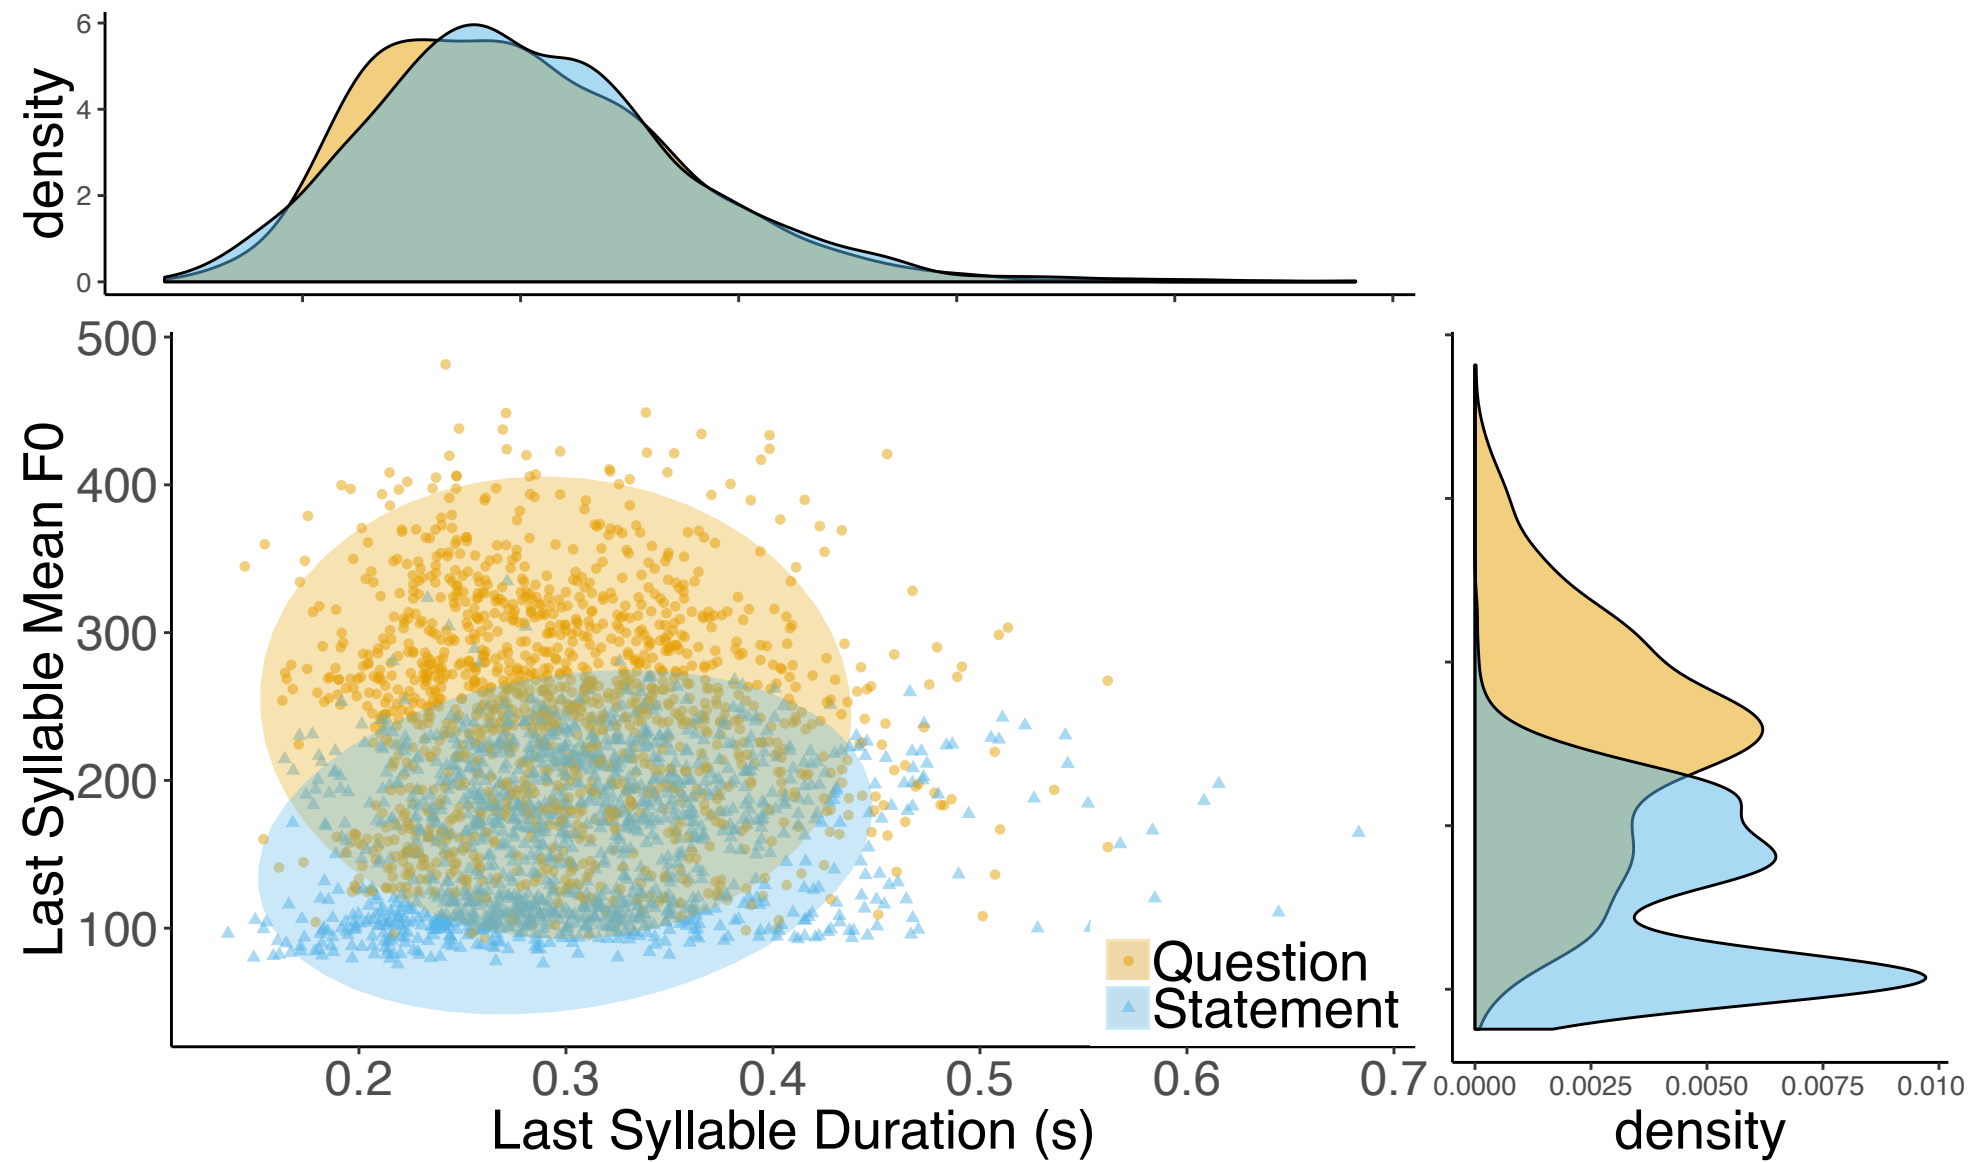

Results I: Raw acoustic values

Results I: Raw acoustic values

Results I: Raw acoustic values

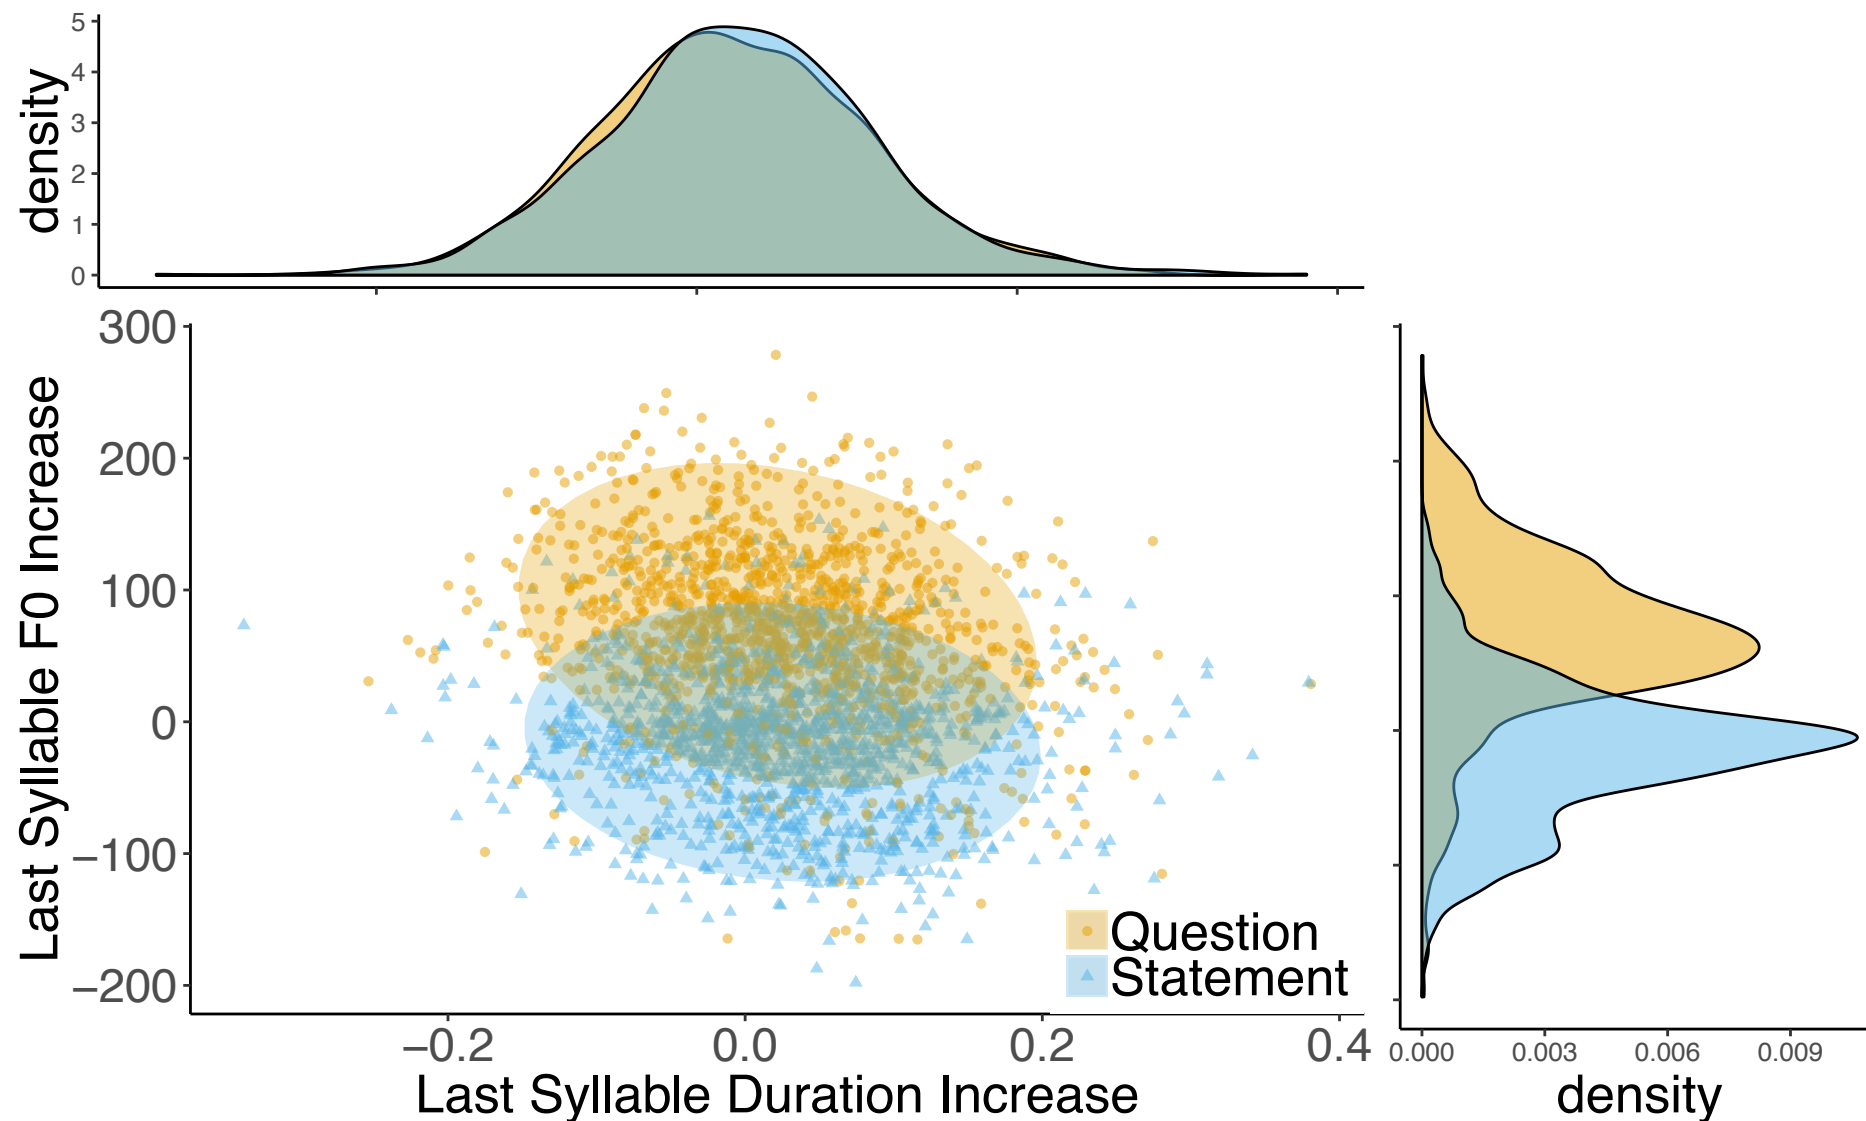

Normalized: Speaker means

- mean of all sentences produced by **a given speaker**.

Normalized: Preceding context

- mean of the 2nd syllable (It's X-ing) in the same token

Across talker variability

- Normalization does not fully resolve the ambiguity
→ Can listeners adapt to speaker specificity?

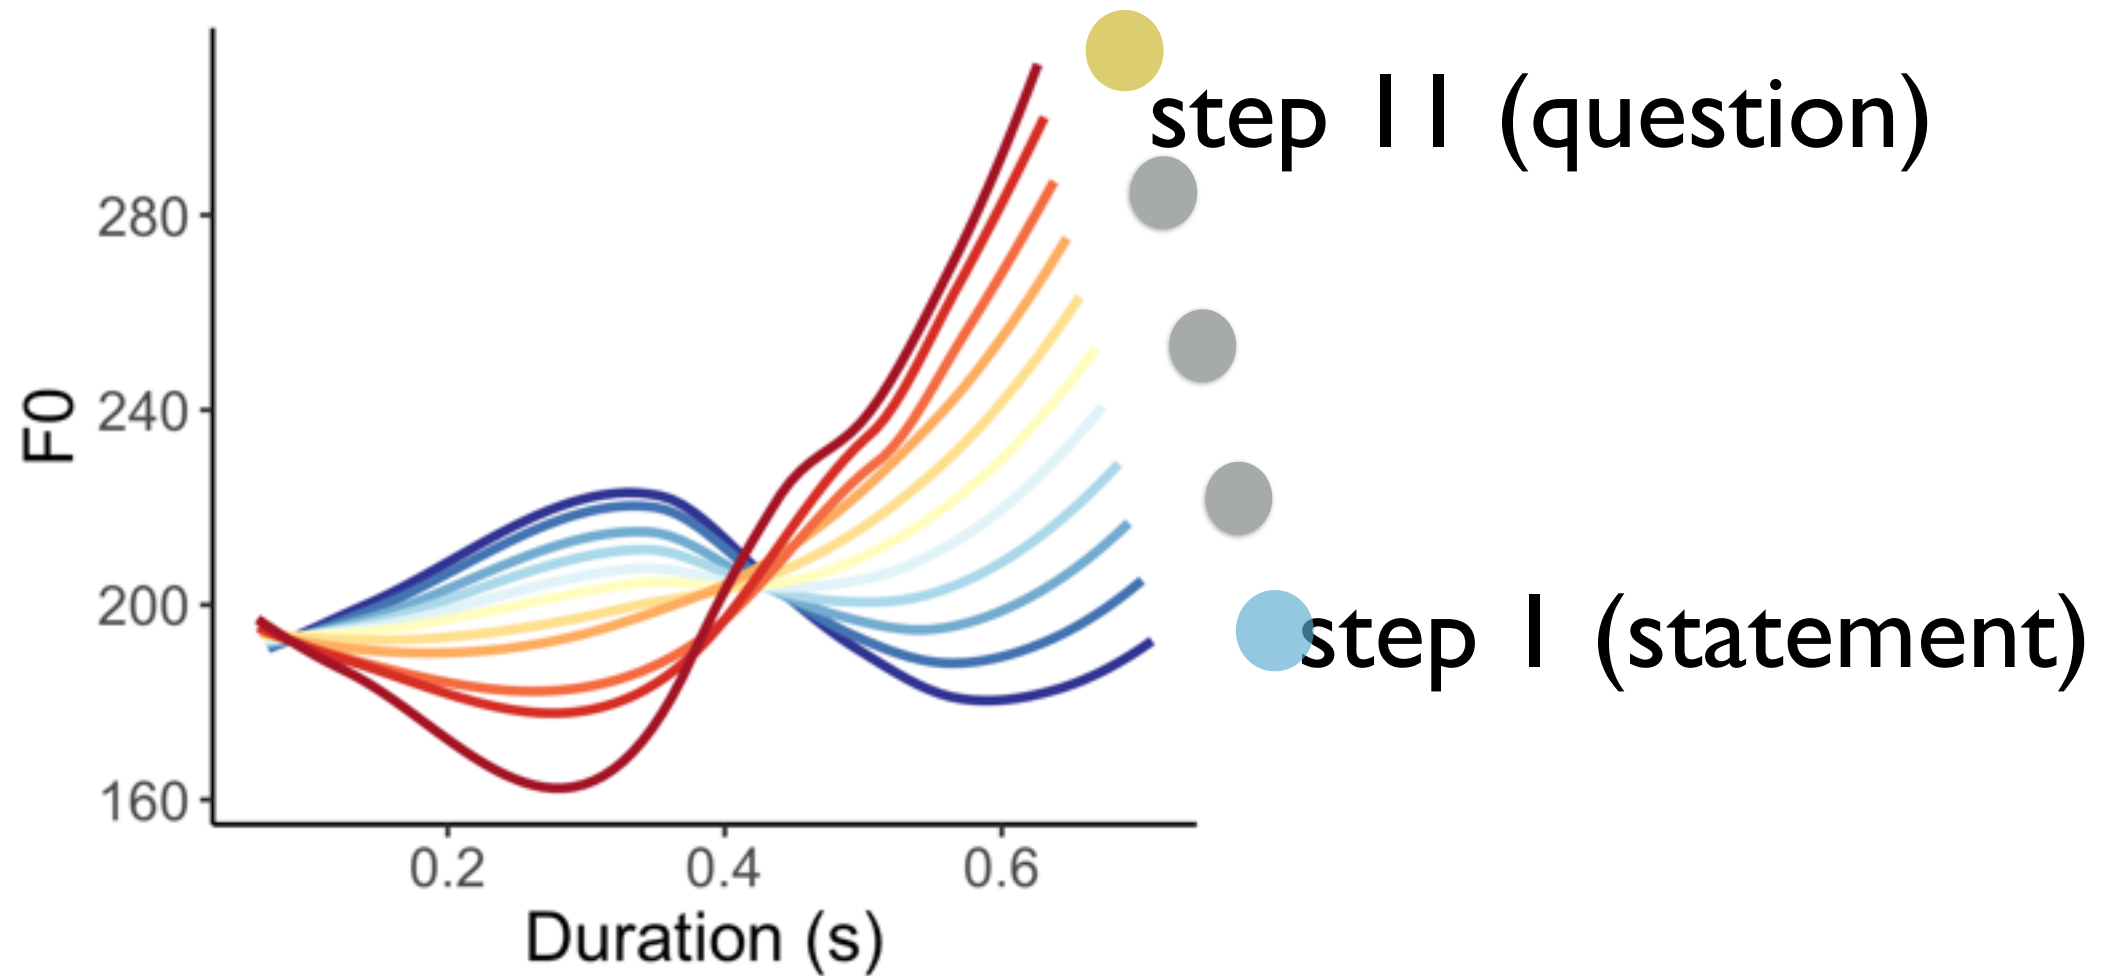

Adaptation to speaker's intonations?

- prediction: depending on the patterns of production by a given speaker, **ambiguous tokens receive opposing interpretations**

Study 2: Stimuli

“It’s moving”

Study 2: Design (n=180)

Pre-exposure (22 trials)

- ▶ “It’s cooking” sampled from Steps 1-11
- ▶ 2AFC: “Is this a question or a statement?”

Exposure (30 trials) with feedback

- ▶ 3 between-subject conditions

Post-exposure (22 trials)

- ▶ materials and task identical to the pre-exposure

Question-biasing

Non-ambiguous

Statement-biasing

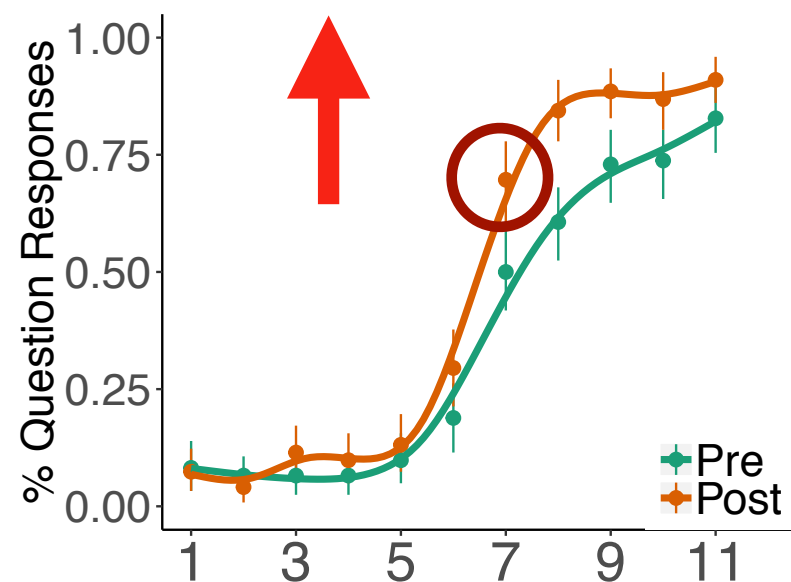

step 1 3 5 7 9 11

1 3 5 7 9 11

1 3 5 7 9 11

statement-like

↑
most
question-like

Summary

- Adapting to acoustics - intonation mappings facilitates reliable interpretations of the speaker intention

Conclusions

- There is substantial variability in acoustic realizations of intonation contours

Conclusions

- ▶ There is a substantial variability in acoustic realizations of intonation contours
- ▶ Adaptation leads to better inference over acoustics intonation mapping **intended by the given speaker**

Thank you!
